

RESPONSE TO SYSTEMIC THERAPIES IN GRANULOMATOUS CHEILITIS: RETROSPECTIVE MULTICENTER SERIES OF 61 PATIENTS

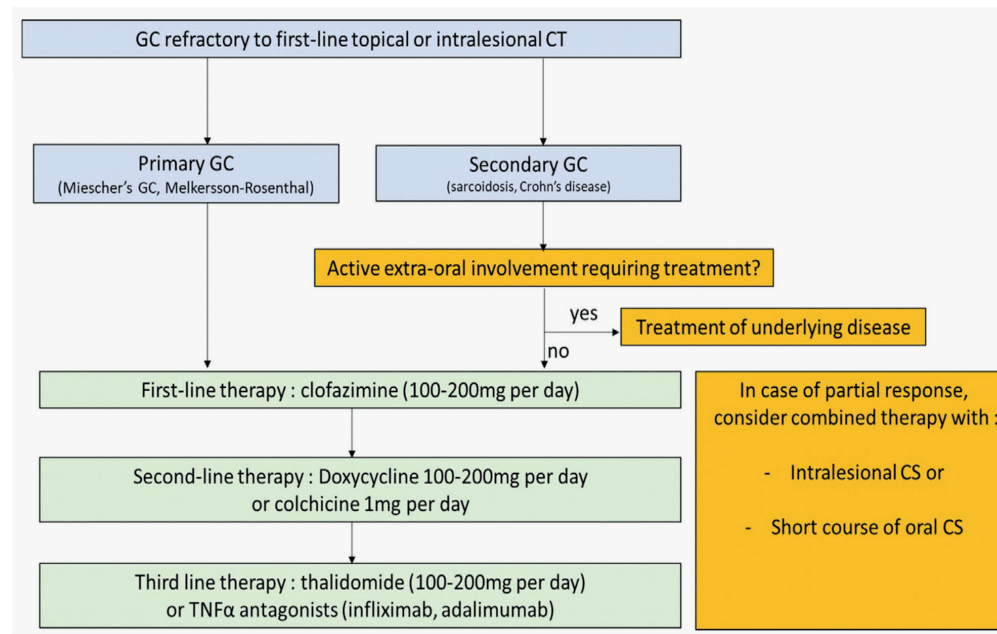

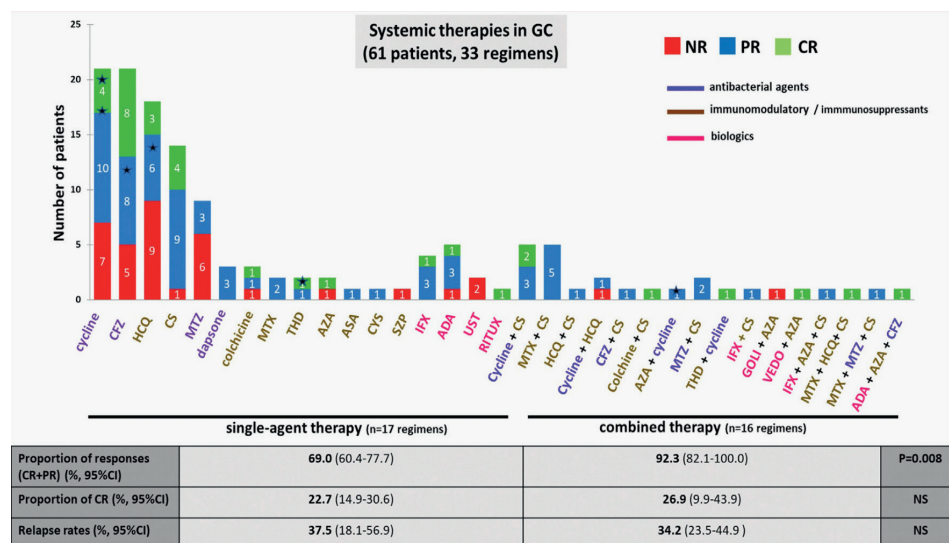

i MULTICENTER RETROSPECTIVE STUDY

61 PATIENTS WITH GRANULOMATOUS MACROCHEILITIS (GC)
(MIESCHER N=38, MELKERSSON ROSENTHAL N=9, SECONDARY GC N=14)

INVESTIGATION OF SYSTEMIC TREATMENTS RECEIVED

- ▶ Intralesional or systemic corticosteroids are hardly manageable for the treatment of granulomatous macrocheilitis (GC).
- ▶ Various systemic therapies have been suggested.

- ▶ Therapeutical algorithm considering response rates, benefit/risk ratio, and long-term duration of response for each drug.
